

Normal Distribution

# Results

n:	5000	sample size
$\bar{x}$ :	0.000261342	sample average
median:	0.000801	sample median
S:	0.250116	sample standard deviation
SS:	312.728111	Sum of Squares
b:	17.681503	b statistic
skewness:	-0.00110469	potentially <b>symmetrical</b> (z=0) 📈
Excess kurtosis:	-0.0683631	potentially <b>mesokurtic</b> , normal like tails
p-value:	0.718649	the probability the data was sampled from a normal distribution
Outliers	-0.855722,-0.822	observation point that is distant from other observations

Results of NIST Tests

## Shapiro-Wilk test, using right tailed normal distribution

### 1. $H_0$ hypothesis

Since  $p\text{-value} > \alpha$ , we accept the  $H_0$ .

It is assumed that the data is normally distributed.

In other words, the difference between the data sample and the normal distribution is not big enough to be statistically significant.

### 2. P-value

p-value is **0.718649**, hence, if we would reject  $H_0$ , the chance of type1 error (rejecting a correct  $H_0$ ) would be too high: 0.7186 (71.86%)

The larger the p-value, the more it supports  $H_0$

### 3. The statistics

W is **0.999704**. It is in the 95% critical value accepted range: [0.9993 : 1.0000]
